DeliGuard®

Pet's health you can see+

Apsel - DeliGuard therapy

Border Collie | 7 years old

The gut microbiome, once called the microflora, is a fully specialised ecosystem that supports the body on a multisystem level. This is all thanks to their metabolism, which as an end product gives us, for example, short-chain fatty acids, B vitamins, vitamin K2. It is these metabolites that are the key to health.

In canine and feline dysbiosis, it is very difficult to get a specialised probiotic to help rebuild the specialised microbiome as well, so that it in turn can produce species-specific metabolites. In addition, the poor state of the organ that is the habitat and proliferation site for probiotic bacteria, the intestines, can be an impediment.

The solution may be postbiotics, which will introduce valuable metabolites while regulating dysbiosis.

DeliGuard is a postbiotic *Bacillus subtilis* bacterium, which in numerous studies on dogs as a probiotic supplement, i.e. live strains, has produced amazing results in improving faecal quality and reducing faecal odour, improving protein digestibility, reducing the duration of diarrhoea, positively influencing the quality of the microbiome and biochemical blood values.

DeliGuard will be an ideal addition to the diet in states of dysbiosis, IBD, SIBO, enetropathies, but also during periods of increased exertion, convalescence, malnutrition states.

For healthy dogs, it will be an element of dietary enrichment that will aid the digestion of dry food or improve the condition of the hair coat. I recommend DeliGuard to everyone.
